

Adobe Illustrator's color space needs to be set to the working space in which the Sublimation ICC Profile was created. This then allows for a more accurate screen display of your images. The accuracy of the displayed image on your monitor will be highly dependent on the quality of your monitor and, more importantly, a calibrated monitor ICC profile.

Start **Illustrator CS** and bring up the color settings window by clicking **Edit > Color Settings**.

- 1 Set the **Working Spaces > RGB:** to **Adobe RGB (1998)**.
- 2 Set the **Color Management Policies > RGB** to **Convert to Working Space**.

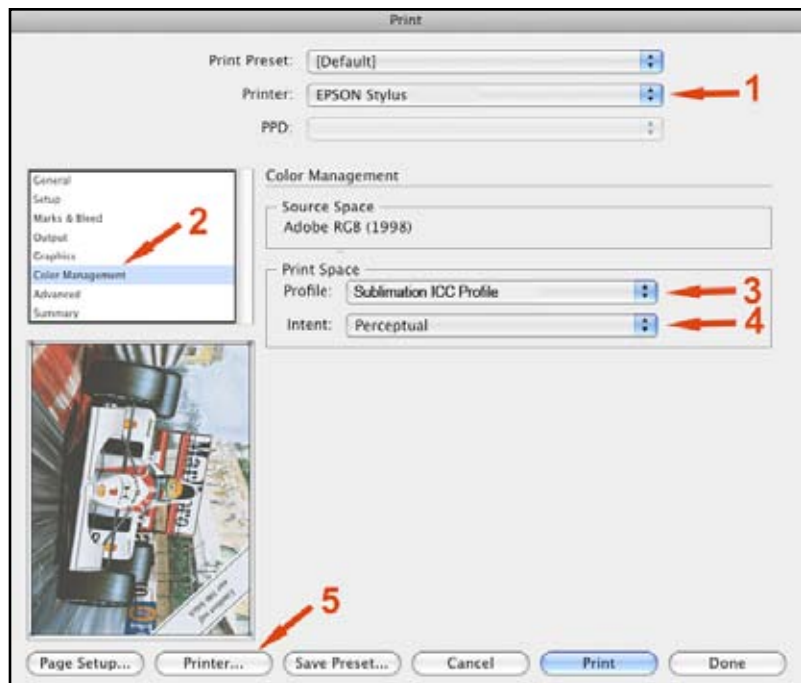

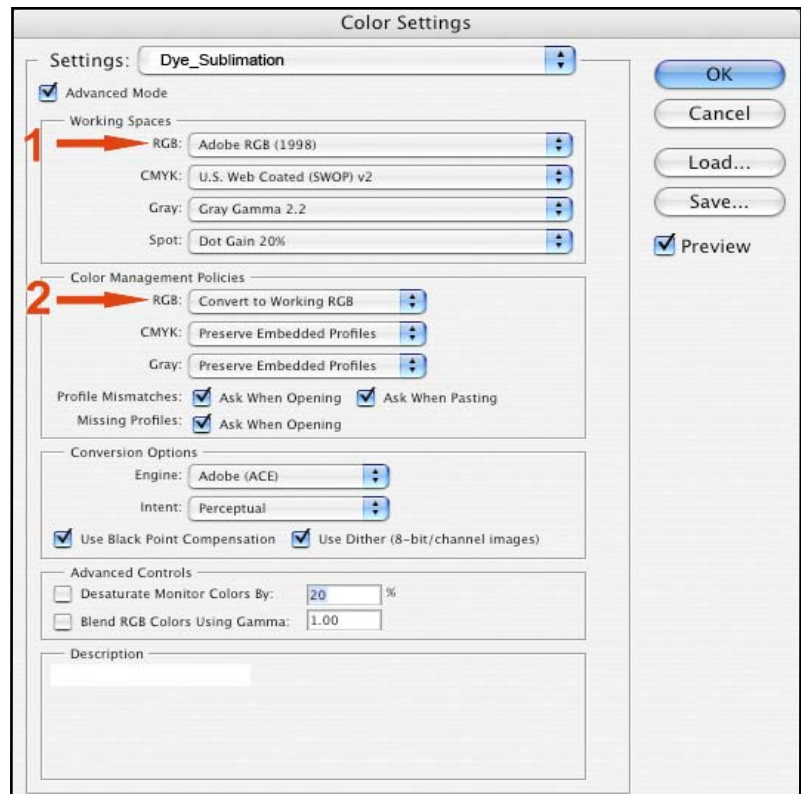

Leave the other settings as shown at right. Click **Save**, then name the settings appropriately.

Illustrator's RGB working space is now set, and you can edit your images as you normally do.

When your image is ready to print, click **File > Print**.

- 1 Select the appropriate printer from the drop-down menu.
- 2 Select **Color Management** from the menu.
- 3 Under **Print Space > Printer Profile**, select the appropriate ICC Profile from the menu.
- 4 Under **Print Space > Intent**, select **Perceptual**.
- 5 Click **Printer...** to open the printer driver settings.

Note: If you do not see any reference to **Sublimation ICC Profile** in the print space list, this means that either the **ICC** profile is not installed in your system, or **Illustrator** has not been restarted since the profile was installed. This installation requires that **Illustrator** be restarted.
